

Newsletter 13/2021

Mindfullybalanced.co.uk

Date: 22nd May 2021

Contents of this newsletter:

Section 1: Update weekly sessions

Section 2: Quick read – Five Ways Mindfulness Meditation Is Good for Your Health

Section 1:

Update weekly community sessions

Next week's timetable is below.

Monday 24th May - 9am and 8.30pm
Tuesday 25th May 7.30pm Movement for Cancer

Wednesday 26th May - 9am
Thursday 27th May – 6.30pm
Friday 28th May - 9am and 11.30am

Saturday 29th May 11am
No session on Sunday 30th May.

If you want the Zoom code for any of the session(s) you would like to attend, please contact me through my website's 'contact page'

The Sunday morning sessions will run in June on the following days

Between 10am – 11am on Sundays 6th, 13th, 20th and 27th

Thanks for a brilliant session today, Pete. My painful neck eased up during the exercises and the music was great. JL May 2021

Section 2:

A bit of a longer - Quick Read:

Five Ways Mindfulness Meditation Is Good for Your Health

Research suggests that mindfulness benefits our bodies, not just our minds.

BY [JILL SUTTIE](#) | OCTOBER 24, 2018 (TAKEN FROM AN ARTICLE IN GREATER GOOD MAGAZINE)

According to thousands of years of tradition, Buddhists meditate to understand themselves and their connections to all beings. By doing so, they hope to be released from suffering and ultimately gain enlightenment.

In recent decades, researchers have been gaining insight into the benefits of practicing this ancient tradition. By studying more secular versions of mindfulness meditation, they've found that learning to pay attention to our current experiences and accept them without judgment might indeed help us to be happier. Studies to

date suggest that mindfulness affects many aspects of our psychological well-being—[improving our mood](#), [increasing positive emotions](#), and [decreasing our anxiety, emotional reactivity, and job burnout](#).

But does mindfulness affect our bodies as well as our minds?

Recently, researchers have been exploring this question—with some surprising results. While much of the early research on mindfulness relied on pilot studies with biased measures or limited groups of participants, more recent studies have been using less-biased physiological markers and randomly controlled experiments to get at the answer. Taken together, the studies suggest that mindfulness may impact our hearts, brains, immune systems, and more.

Though nothing suggests mindfulness is a standalone treatment for disease nor the most important ingredient for a healthy life, here are some of the ways that it appears to benefit us physically.

Mindfulness is good for our hearts

Heart disease is the [leading killer](#) in the United States, accounting for about 1 in 4 deaths every year. So, whatever decreases the risks or symptoms of heart disease would significantly impact society's health. Mindfulness may help with that.

In [one study](#), people with pre-hypertension were randomly assigned to augment their drug treatment with either a course in mindfulness meditation or a program that taught progressive muscle relaxation. Those who learned mindfulness had

Newsletter 13/2021

significantly greater reductions in their systolic and diastolic blood pressure than those who learned progressive muscle relaxation, suggesting that mindfulness could help people at risk for heart disease by bringing blood pressure down.

In [another study](#), people with heart disease were randomly assigned to either an online program to help them practice meditation or to a waitlist for the program while undergoing normal treatment for heart disease. Those who took the mindfulness program showed significant improvements on the six-minute walking test (a measure of cardiovascular capacity) and slower heart rates than those in the waitlist group. While one [review](#) of randomly controlled studies showed that mindfulness may have mixed effects on the physical symptoms of heart disease, a [more recent review](#) published by the American Heart Association concluded that, while research remains preliminary, there is enough evidence to suggest mindfulness as an adjunct treatment for coronary disease and its prevention.

Mindfulness may also be good for hearts that are already relatively healthy.

Research suggests that meditating can [increase respiratory sinus arrhythmia](#), the natural variations in heart rate that happen when we breathe that [indicate](#) better heart health and an increased chance of surviving a heart attack.

Mindfulness may decrease cognitive decline from aging or Alzheimer's

People tend to lose some of their cognitive flexibility and short-term memory as they age. But mindfulness may be able to slow cognitive decline, even in people with Alzheimer's disease.

In [a 2016 study](#), people with Alzheimer's disease engaged in either mindfulness meditation, cognitive stimulation therapy, relaxation training, or no treatment, and were given cognitive tests over two years. While cognitive stimulation and relaxation training seemed to be somewhat beneficial in comparison to no treatment, the mindfulness training group had much more robust improvements on cognitive scores than any other group.

Why might that be true? A [2017 study](#) looking at brain function in healthy, older adults suggests meditation may increase attention. In this study, people 55 to 75 years old spent eight weeks practicing either focused breathing meditation or a control activity. Then, they were given the Stroop test—a test that measures attention and emotional control—while having their brains monitored by electroencephalography. Those undergoing breath training had significantly better attention on the Stroop test and more activation in an area of the brain associated with attention than those in the active control group.

While this research is preliminary, a [systematic review](#) of research to date suggests that mindfulness may mitigate cognitive decline, perhaps due to its effects on memory, attention, processing, and executive functioning.

Newsletter 13/2021

Mindfulness may improve your immune response

When we encounter viruses and other disease-causing organisms, our bodies send out troops of immune cells that circulate in the blood. These cells, including pro- and anti-inflammatory proteins, neutrophils, T-cells, immunoglobulins, and natural killer cells, help us to fight disease and infection in various ways. Mindfulness, it turns out, may affect these disease-fighting cells.

In [several](#) studies, mindfulness meditation appeared to increase levels of [T-cells](#) or [T-cell activity](#) in patients with HIV or breast cancer. This suggests that mindfulness could play a role in fighting cancer and other diseases that call upon immune cells. Indeed, in people suffering from cancer, mindfulness appears to

improve a [variety](#) of biomarkers that might indicate progression of the disease.

[In another study](#), elderly participants were randomly assigned to an eight-week Mindfulness-Based Stress Reduction (MBSR) course or a moderate-intensity exercise program. At the end, participants who'd practiced mindfulness had higher levels of the protein interleukin-8 in their nasal secretions, suggesting improved immune function.

Another [study](#) found increases in interleukin-10 in colitis patients who took

a mindfulness meditation course compared to a mind-body educational program, especially among patients whose colitis had flared up. Yet another [study](#) found that patients who had greater increases in mindfulness after an MBSR course also showed faster wound healing, a process regulated by the immune system.

Studies have found effects on markers of inflammation, too—like C-reactive protein, which in higher levels can harm physical health. [Research](#) shows that people with rheumatoid arthritis have reduced C-reactive protein levels after taking an MBSR course versus being on a waitlist for the course. [Overall](#), these findings suggest that mindfulness meditation can have disease-fighting powers through our immune response.

Mindfulness may reduce cell aging

Cell aging occurs naturally as cells repeatedly divide over the lifespan and can also be increased by disease or stress. Proteins called telomeres, which are found at the end of chromosomes and serve to protect them from aging, seem to be impacted by

Studies suggest that long-time meditators may have greater telomere lengths. In one experimental study researchers found that breast cancer survivors who went through MBSR preserved the length of their telomeres better than those who were on a waitlist. However, this study also found that general supportive therapies impacted telomere length; so, there may not be something special about MBSR that impacts cell aging.

On the other hand, another study with breast cancer survivors found no differences in telomere length after taking an MBSR course; but they did find differences in

Newsletter 13/2021

telomere activity, which is also related to cell aging. In fact, a [2018 review](#) of research ties mindfulness training to increased telomere activity, suggesting it indirectly affects the integrity of the telomeres in our cells. Perhaps that's why scientists are [at least optimistic](#) about the positive effects of meditation on aging.

Mindfulness may help reduce psychological pain

Of course, while the above physiological benefits of mindfulness are compelling, we needn't forget that mindfulness also impacts our psychological well-being, which, in turn, affects physical health. In fact, it's quite likely that these changes have synergistic effects on one another.

First of all, a great deal of research suggests that mindfulness can help healthy people [reduce their stress](#). And thanks to Jon-Kabat Zinn's pioneering MBSR program, there's now a [large body of research](#) showing that mindfulness can help people cope with the [pain](#), [anxiety](#), [depression](#), and [stress](#) that might accompany illness, especially chronic conditions.

For example, drug addictions, at heart, come about because of physiological cravings for a substance that relieves people temporarily from their psychological suffering. Mindfulness [can be](#) a useful adjunct to addiction treatment by helping people better understand and tolerate their cravings, potentially helping them to avoid relapse after they've been safely weaned off of drugs or alcohol. The same [is true](#) for people struggling with overeating.

Fascinating though it is, we shouldn't overplay meditation's effects on physical health at the expense of its importance to emotional health. In fact, it may be difficult to separate out the two, as a key impact of mindfulness is stress reduction, and psychological stress has been tied

to [heart health](#), [immune response](#), and [telomere length](#). This idea is further supported by the fact that [other stress-reducing therapies](#) also seem to impact physical health, as well.

Still, it's encouraging to know that something that can be taught and practiced can have an impact on our overall health—not just mental but also physical—more than 2,000 years after it was developed. That's reason enough to give mindfulness meditation a try.

Yay!!!

Take care everyone.

With kindness

Pete
